                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method for identifying a bacteriophage coding region encoding a product active on an essential bacterial target. The method comprises identifying a nucleic acid sequence encoding a gene product that provides a bacteria-inhibiting function when an uncharacterised bacteriophage infects a pathogenic bacterium. The compound active on a target of a bacteriophage inhibitor protein in a bacterial sused to treat or prevent a bacterial infection in an animal. AAA68243 to AAA69442 and AAB15523 to AAB16954 represent bacteriophage pucleotide and protein sequences which are used in the exemplification of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the

                                                                                                                                                 The present invention describes a method for identifying a bacteriophage coding region encoding a product active on an essential bacterial target. The method comprises identifying a nucleic acid sequence encoding a gene product that provides a bacteria-inhibiting function when an uncharacterised bacteriophage infects a pathogenic bacterium. The compound active on a target of a bacteriophage inhibitor protein in a bacteria is used to treat or prevent a bacterial infection in an animal. AAA68243 to AAA69442 and AAB16523 to AAB16954 represent bacteriophage nucleotide and protein sequences which are used in the exemplification of the present invention.

The method comprises identifying a nucleic acid sequence encoding a gene product that provides a bacteria-inhibiting function when an uncharacterised bacteriophage infects a pathogenic bacterium. The compound active on a target of a bacteriophage inhibitor protein in a bacteria is used to treat or prevent a bacterial infection in an animal. AAA68243 to AAA6942 and AAB16523 to AAB16524 represent bacteriophage nucleotide and protein sequences which are used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel plant transcription factors from Eucalyptus grandis or Pinus radiata. The present sequence is the coding sequence for one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box binding factors, basic helix-loop-helix zipper, LIM domain, AP2 and EREBs, zinc finger domains of type 2 Cys2His2, CCAAT box elements
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    plant; transcription factor; gene expression; eucalyptus; pine; poplar; sweetgum; teak; mahogang; bZIP; G-box binding factor; basic helix-loop-helix zipper; homeotic; homeodomain; homeobox; homeodomain zipper; LIM domain; AP2; EREBs; zinc finger domain; type 2 Cys2His2; CCAAT box element; MYB; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoissis regulating activity, tissue growth factor activity, immunomodulatory activity and activiny inhibin activity and may be useful in the diagnosis and/or activity interest activity and may be useful in the diagnosis and/or activiny inhibin activity and may be useful in the diagnosis and/or activity.

Cancer cells can be treated with TAXOL when they are shown to express one of the 242 sensitivity markers or the cells are shown not to express one of the 804 resistance markers. The methods can be used to determine the effectiveness of TAXOL in the treatment of cancer cell growth in an individual. The markers can be used as targets in developing anti-cancer agents such as chemotherapeutic compounds. The markers can also be used as targets in developing treatments for cancer, particularly those cancers which display resistance to agents and exhibit expression of the markers. The anticancer agents developed by the movel method can be used to treat cancer agents developed by the movel method can be used to treat cancer agents developed by the movel method can be used to treat cancer agents developed by the movel method can be used to treat cancer agents developed by the movel method can be used to treat cancer agents developed by the movel method can be used to treat cancer agents developed by the movel method can be used to treat cancer agents.
                                                                                                                                                                                                                                                                                                                                                                                                            cancer. Probes based on the markers can be used to detect transcripts or genomic sequences corresponding to the markers, in the identification of cells or tissues which mis-express the protein. Cancers which may be targeted include carcinoma (e.g. squamous cell carcinoma), sarcoma (e.g. fibrosarcoma) leukaemia (e.g. lymphocytic leukaemia), lymphoma, plasmocytoma, reticulum cell sarcoma, Hodgkin's disease and tumours (e.g. glioma). The present sequence is one of the 1046

The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of the correlated control of the cell and the correlated control of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of t

The DNAs can be used in forensic procedures to identify individuals or in diagnostic procedures to identify individuals or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal expression of the genes corresponding to the extended cDNAs. They are also useful for constructing a high resolution map of the human chromosomes. They can
                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents an extended human secreted protein coding sequence of the invention. The secreted proteins can be used in treating or controlling a variety of human conditions. The secreted proteins may act as cytokines or may affect cellular proliferation or differentiation or may act as immune system regulators, haematopoiesis regulators, tissue growth regulators, regulators of reproductive hormones or cell movement

                                                                                                                                                                                                                                                                                                                                                                                                                                                  (I) can have respiratory, bronchodilator, antinflammatory, analysis, continuous pressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, bradykinin receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, cytokine and commonstiters, defensins, growth factors, vasoactive peptides and receptors, conditions, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or lung inflammation, allergy(ies) and or condition selected from nulmonary vasoconstriction inflammation and inflammation.
                                                                                                                                                    Local Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base oligonucleotides the A is replaced by a 'Universal' or alternative base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions - \frac{1}{2}
                                                                                                                                                                                                                                                                                                                   pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of

                                                                                                                                                                                                                                                                                                                                                                                e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystifibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the
                                                                                    nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA332323 to AAA33992) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease whose secondary of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; adenosine receptor; low adenosine antisense oligonucleuriue, phosphorothioate; impaired respiration; inflammation; allergy; allergic disease; bronchoconstriction; inhibitor; antinflammatory; allergic disease; bronchoconstriction; inhibitor; antinflammatory;

                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in leucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                       Claim 1; SEQ ID NO 11197; 21pp + Sequence Listing;
                                                                                                                                                                            Sequence 2200 BP;
                                                                                                                                                                                                  at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                              The sequence data for this patent did not form specification, but was obtained in electronic \mathbf{f}
                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid
genes from Drosophila and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence data for this patent did not form part of the pri specification, but was obtained in electronic format directly at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid genes from Drosophila and interactions -

                                                                                                                                                Percent Similarity:
                                                                                                                                                                                                                                                       or diagnose various unsecses und discrete disorders diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin ageing due to sunbburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The molypeptides can also be used as a food additive or preservative to
                                                                                                                                                                                                                                                                                                                                                                                                                                          The proteins and polynucleotides, their agonists and antagonists have activities dependent on the tissues and cells in which they are expressed, examples of these activities include, immunosuppressive; antiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; opthalmalogical; and vulnerary. The proteins, polynucleotides, agonists and antagonists can be used to treat or detect or diagnose various diseases and disorders including, autoimmune

         The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analyesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best Local Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC asthma, impeded respiration, respiratory distress syndrome, pain, cystic CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, CC carcinomas, and cancers which may metastasise to the lungs, including CC breast and prostate cancer. The reduction of the adenosine content of Ct the ONs reduces side effects. The a-containing ONs break down with the CT release of deoxyadenosine which activates adenosine receptors causing C bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the Cnucleotide sequences given in the sequence listing from the present C invention, which correspond to SEQ ID NO:1 to 2815, and then the last C185 sequences are also called SEQ ID NO:1 to 185, but the sequences C (AAA32323 to AAA3392) are specifically claimed ONs from the present C invention. N.B. Sequences given in the disclosure of the present C invention do not match up with their corresponding SEQ ID NO: sequences of the present C invention do not match up with their corresponding SEQ ID NO: sequences of the present C invention of the present C invention of the present C invention do not match up with their corresponding SEQ ID NO: sequences of the present C invention do not match up with their corresponding SEQ ID NO: sequences of the present C invention do not match up with their corresponding SEQ ID NO: sequences of the present C invention do not match up with their corresponding SEQ ID NO: sequences of the present C invention do not match up with their corresponding SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: sequences SEQ ID NO: s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analyssic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vascomstriction, allergies, asthma impoded representation resentations.

Proteins encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum, useful as antimalarial vaccines and in the diagnosis of P.falciparum infection -

Disclosure; Page 488; 577pp; English.

by chromosome 2 of the human malarial parasite, Plasmodium falciparum.

Also described are: (1) nucleotide sequences (II) encoding (I); and (2)

vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against P. falciparum infection comprising (I) or (II).

P. falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many can be approved there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAA81844 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification. present invention describes proteins and their fragments (I) encoded

The protein molecules susful for identifying inhibitors of PDE4 which have antidepressant memory enhancement effects, since the isoforms are expressed in wide range of tissues including various regions of brain. The protein molecules a useful for identifying inhibitors of PDE4 which have antidepressant a memory enhancement effects, since the isoforms are expressed in wide range of tissues including various regions of brain. PDE4 inhibitors causes nausea and trigger other gastrointestinal side effects. The phosphodiesterases function in regulation of physiological processes hydrolysing cAMP, an intracellular signalling molecule derived from A

The sequence is very closely related to, but distinct from, the rat pRATDPD cDNA insert (see AAQ14624).
N.B. This sequence is SEQ ID NO. 22 in the specification but is referred to as SEQ ID NO.23 in the text ,e.g. on page 32.

The sequences given in AAT34374-76 represent plasmid fragments which contain human glioblastoma cell cDNA isserts which are capable of correcting the heat shock sensitivity of the phosphodiesterase deficient yeast strain 10DAB. Several cDNA's were isolated and sequenced. pTM22 encodes a novel human gene. From computer analysis, pTM22 putatively encodes a protein homologous to various cAMP phosphodiesterase, such as the bovine Ca2+/calmodulin dependent cAMP phosphodiesterase and the rat DPD phosphodiesterase. Sequences related to pTM22 were found to be expressed in human heart. Plasmid pTM22 was cunable to correct the heat shock sensitivity of RAS2(vall9) yeast strains. It thus appears that the pdei- and pde2- yeast strain 10DAB is more sensitive to phenotypic reversion by mammalian cAMP phosphodiesterase clones than is the RAS2(vall9) yeast strain. The phosphodiesterase clones than is the RAS2(vall9) yeast strain. The conserts in the plasmids pTM3 and pTM72 were also characterised. These two different cAMP phosphodiesterase cDNA's were found to be closely celated to, but distinct from, the pRAVIDPD insert and the pUG99 insert. Biochemical analysis of cell lysates has established that the cDNA's of phosphodiesterase.
phosphodiesterases.

RAS-related polypeptides are capable of complementing a defective RAS function in yeast. The products can be used for screening for agents which can modify, complement or suppress a genetic defect in a biochemical pathway in which cAMP participates, or in a biochemical pathway which is controlled, directly or indirectly, by a RAS protein and other is controlled, directly or indirectly, by a RAS protein and other proteins affecting cell growth and maintenance. Developing agents that will selectively act upon PDEs is directed toward reproducing the desirable effects of cyclic nucleotides, e.g. bronchodilation, increased myocardial contractility, anti-inflammation, yet without causing the undesirable effects, e.g. increased heart rate or enhanced lipolysis. The products can also be used for therapeutic, diagnostic uses. AAZ32229 to AAZ32285, and AAY49803 to AAY49830,

The present invention describes a purified and isolated DNA (I) which encodes a mammalian cyclic nucleotide phosphodiesterase and is an inserpresent in the plasmids ppDE46 (ATCC 69552), ppDE43 (ATCC 69551) or ppDE339 (ATCC 69550). The DNA molecules are used to modify, complement or suppress a genetic defect in a biochemical pathway in which CAMP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176 ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins
                                                                                                                       Novel isolated DNA encoding a mammalian cyclic nucleotide phosphodiesterase is present in plasmids pPDE46, pPDE43 or pPDE339 and is used to modify a genetic defect in a biochemical pathway in which
                                                                                                                                                                                                                                                                                                                                                                                                                                                Detection; mammalian gene; yeast; microorganism; identification; phenotype; characteristic; dunce-like phosphodiesterase; PDE; RAS; RAS-related protein; genetic defect; hybridisation; probe; ss.
                                                                                    Example 1; Column 95-102;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Best Local Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Percent Similarity:
                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                    New isolated nucleic acid genes from Drosophila and
                                                                                                                                                                                                                                                               WPI; 2001-656860/75.

                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a number of human immune system associate genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal cytosine methylation \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1065

                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPC at the printed at the part of the printed at the part of the printed at the part of the printed at the part of the printed at the part of the printed at the part of the printed at the part of the printed at the part of the printed at the part of the printed at the part of the printed at the part of the printed at the part of the part of the printed at the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part of the part

AAK54951 to AAK64702 encode the human immune/haematopoletic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) croteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectlifying mutations or deletions in a patient's genome chart affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) cytopolymucleotides may be used to produce the secreted (I), by inserting complement in proteins on bost cell and culturing the cell to express the corotein. (I) proteins and polynucleotides may be used to prove the secreted (I), by inserting consers and cancer metastases of haematopoletic-derived cells. AAK64703 connecrs and cancer metastases of haematopoletic antigen genomic connecrs from the present invention. AAK54942 to AAK54950 and AAM62169 crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               08-DEC-2000;

Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoletic-related diseases, especially cancers and cancer metastases of haematopoletic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoletic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.

Claim 1; SEQ ID NO 20110; 21pp + Sequence Listing; English.

discloses genomic DNA sequences (ABL16176-ABL30511), esequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling invention alling and is

at ftp.wipo.int/pub/published_pct_sequences. The sequence data for this patent did not form specification, but was obtained in electronic f m part of the printed format directly from WIPO

Sequence 7275 BP; 1980 A; 1650 C; 1792 G; 1853 T; 0 other;

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic cactivity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) concerns may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to protein collators and treat immune/haematopoietic-related diseases, especially concers and cancer metastases of haematopoietic antigen genomic to AAK87694 represent human immune/haematopoietic antigen genomic concerns and cancer metastases of haematopoietic antigen genomic to AAK87694 represent human immune/haematopoietic antigen genomic concerns and cancer metastases of haematopoietic antigen genomic than the present invention. The inventuaseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL18176-ABL30511), expressed DNA sequences (ABL1840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel genes (ABA11004-ABA21534) and proteins (C (ABB14678-ABB18001) useful for preventing, treating or ameliorating comedical conditions e.g. by protein or gene therapy. The genes are comedical conditions e.g. by protein or gene therapy. The genes are considered from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful converian cancer and other cancers of the adrenal gland, bone, bone compared the conversal cancer and other cancers of the adrenal gland, bone, bone compared the conversal cancer and other cancers of the adrenal gland, bone bone compared the conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conversal conve

(I) have cytostatic cartivity, and can be used in gene therapy and vaccine production. (I) crowning proteins and polynucleotides may be used in the prevention, diagnosis and care treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased compression by rectifying mutations or deletions in a patient's genome complement the patients own production of (I). Additionally, (I) complement the patients own production of (I). Additionally, (I) complement the patients own production of (I). Additionally, (I) complement to a host cell and culturing the cell to express the complement. (I) proteins and polynucleotides may be used to produce the secreted (I), by inserting compose and treat immune/haematopoietic related diseases, especially cancers and cancer metastases of haematopoietic derived cells. AAK64703 concers from the present invention. AAK54920 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                            Best I

```
Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -
```

```
Disclosure; SEQ ID NO 40194; 3071pp + Sequence Listing; English
```

ankis 4951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with happropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoletic-related diseases, especially conners and cancer metastases of haematopoletic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoletic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                      Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal

                                                                                                                                                                                                                                             Score:
                                                                The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, ADIS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatoryVulcerative bowel diseases. The present sequence is a gene of the invention.
